

Metro Manila Transportation Network: Big Data Analytics and Applications (MMTN:BDAA)

A DOST-PCIEERD Funded Research Project

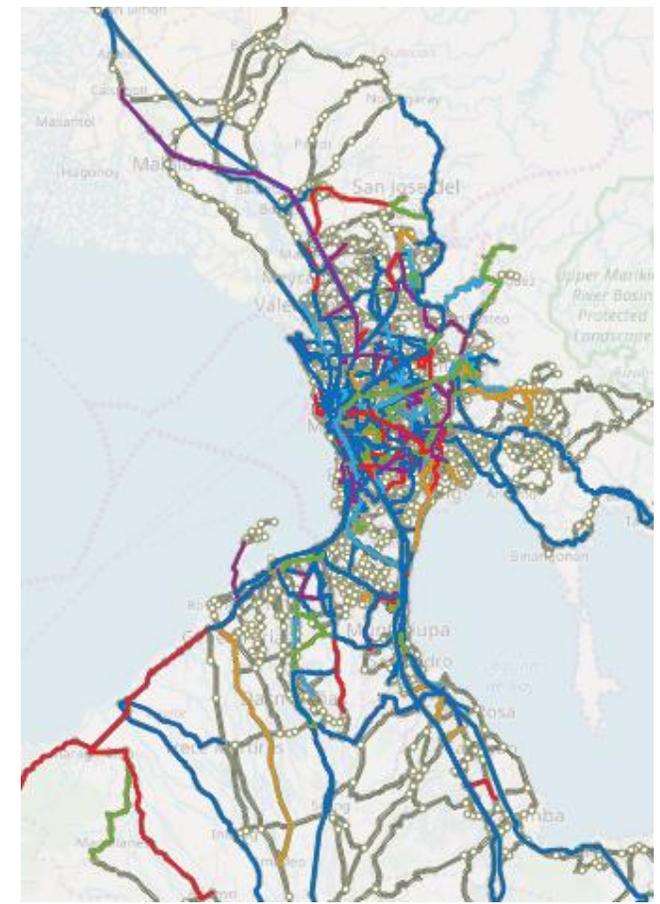

Alexis Fillone, PhD

Project Leader, MMTN:BDAA

DLSU-Manila

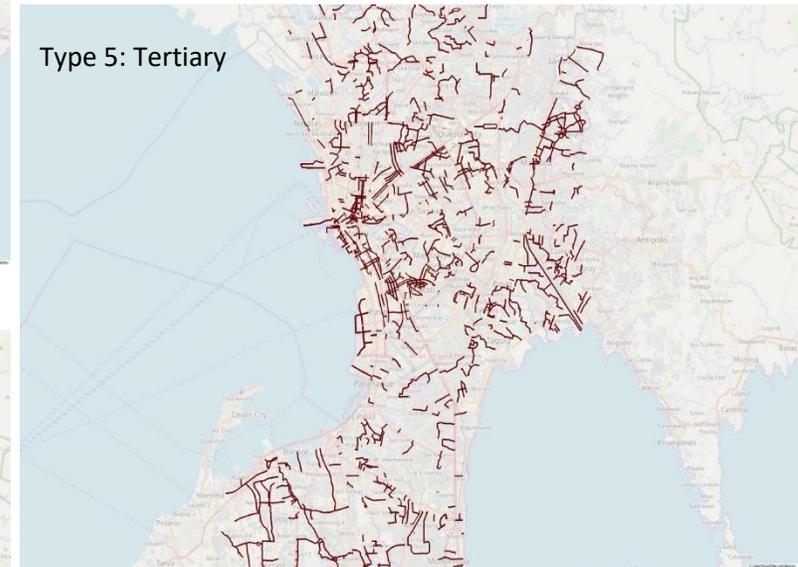

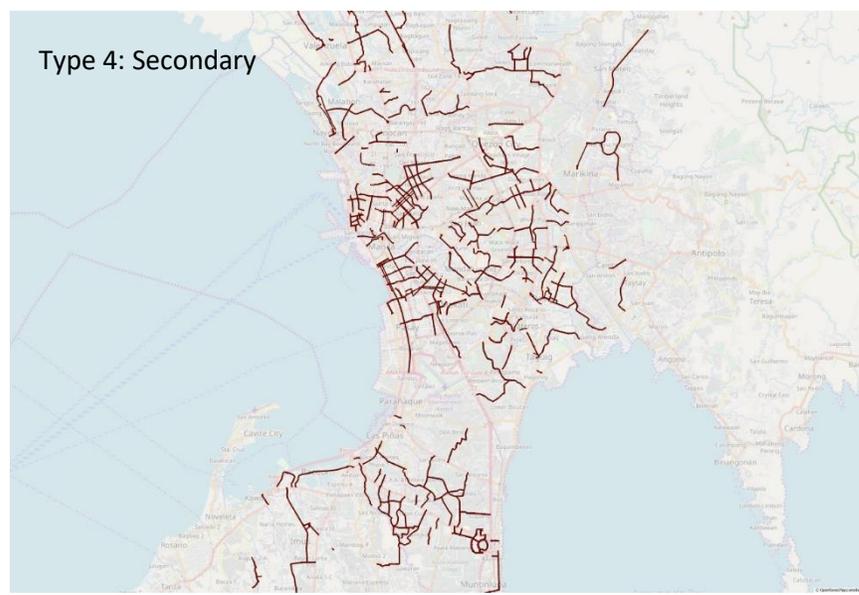

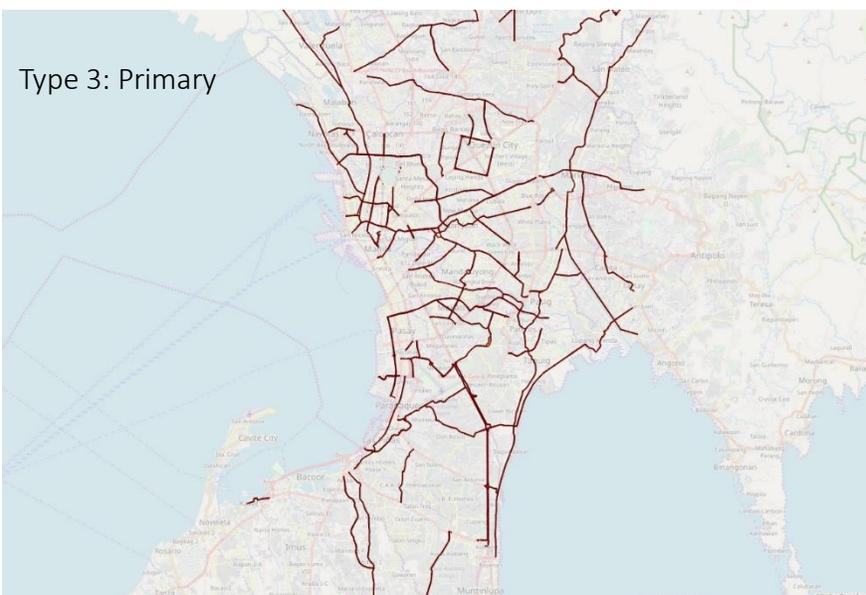

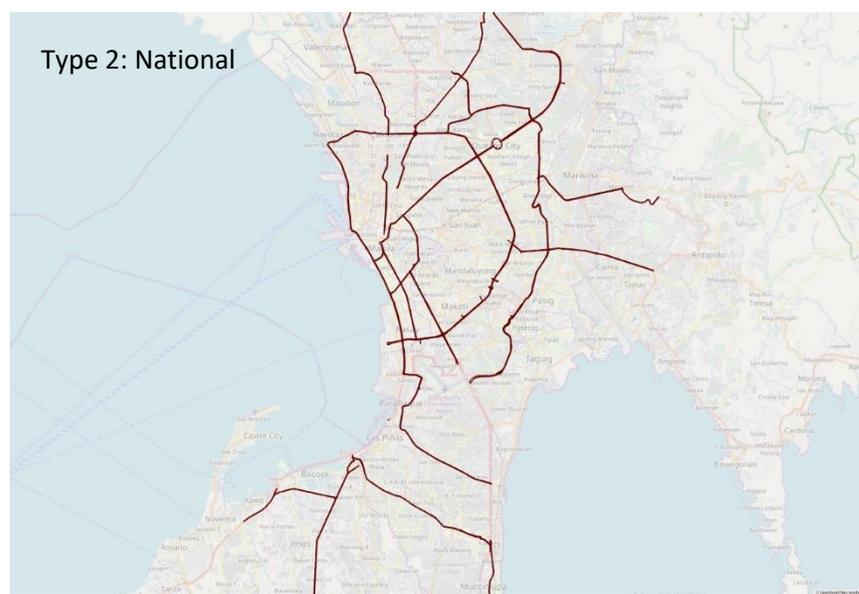

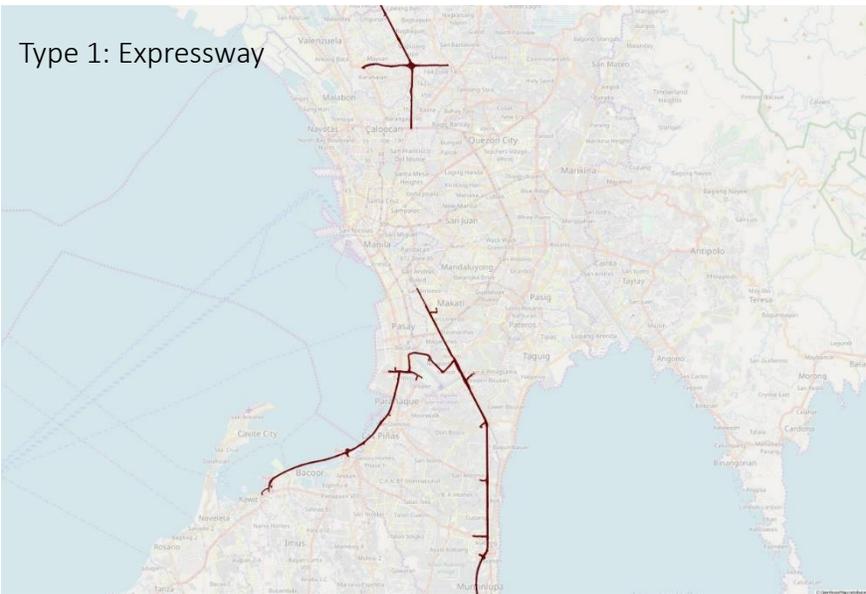

Primary Objective: To model and assess the existing transportation network and transport-related facilities of Metro Manila as well as planned transport infrastructure projects or combination thereof, at the local (city) and metro-wide levels (Metro Manila) with the end objective of developing a transport database system

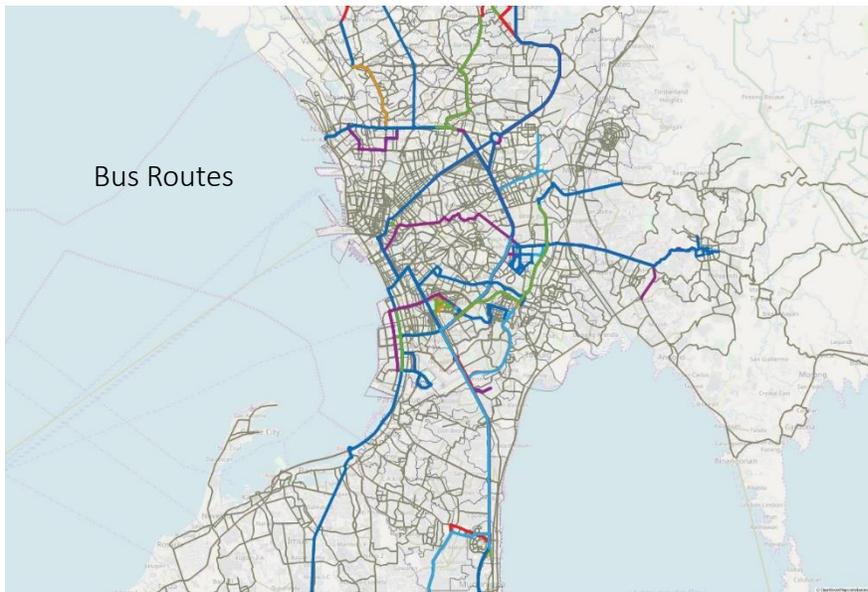

EMME Network

Centroids	453
Nodes	6946
Links	17216
Transit Lines	876

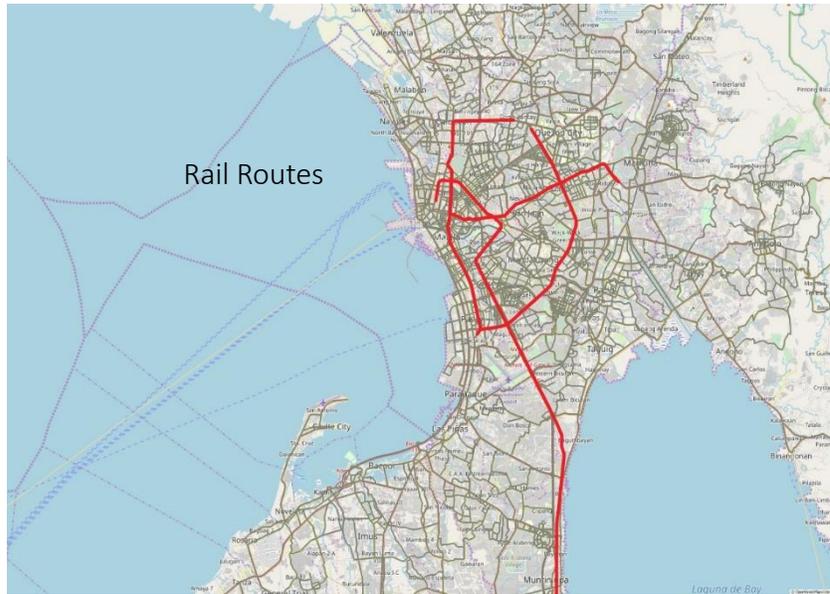

Road Tier Classification

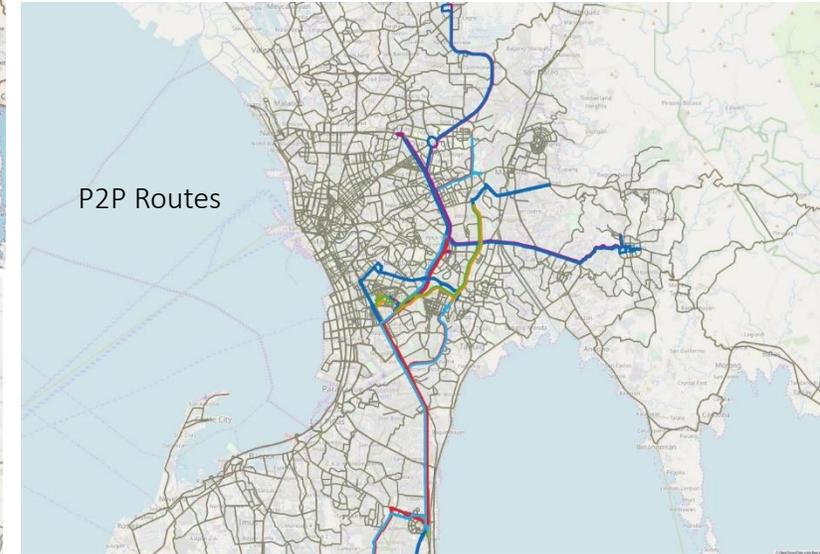

Bus Routes

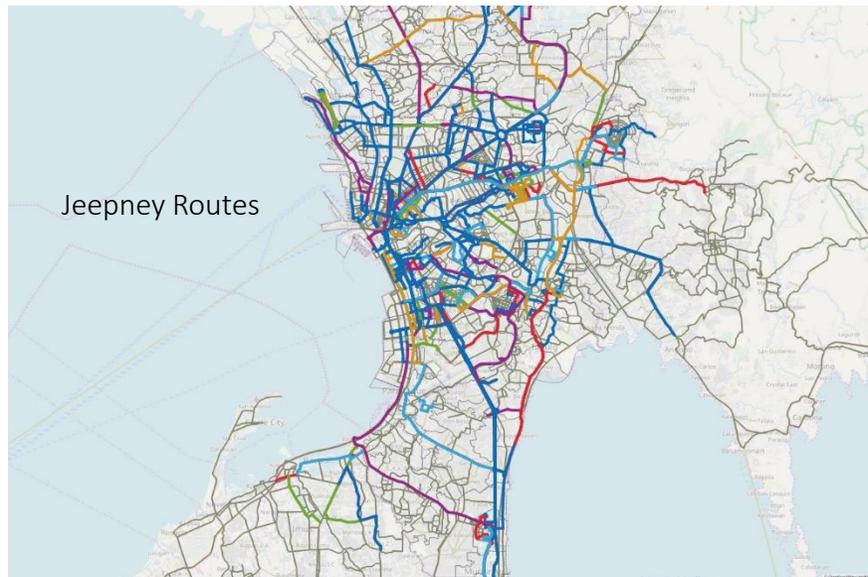

Rail Routes

P2P Routes

Jeepney Routes

AUV Routes

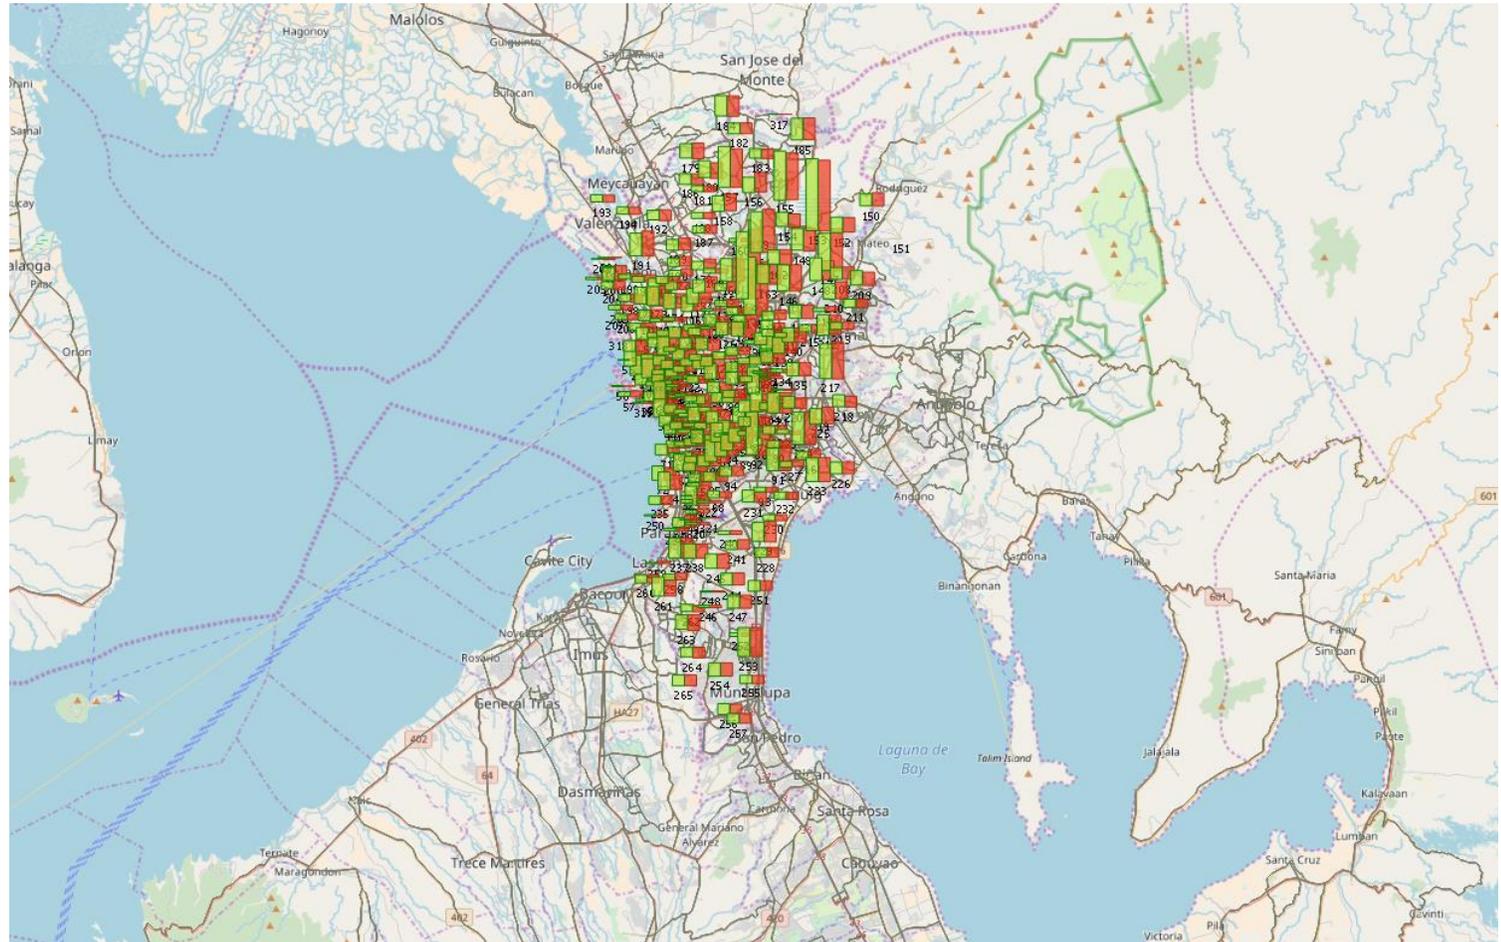

Around 876 transit lines

Public Transport Routes in Metro Manila

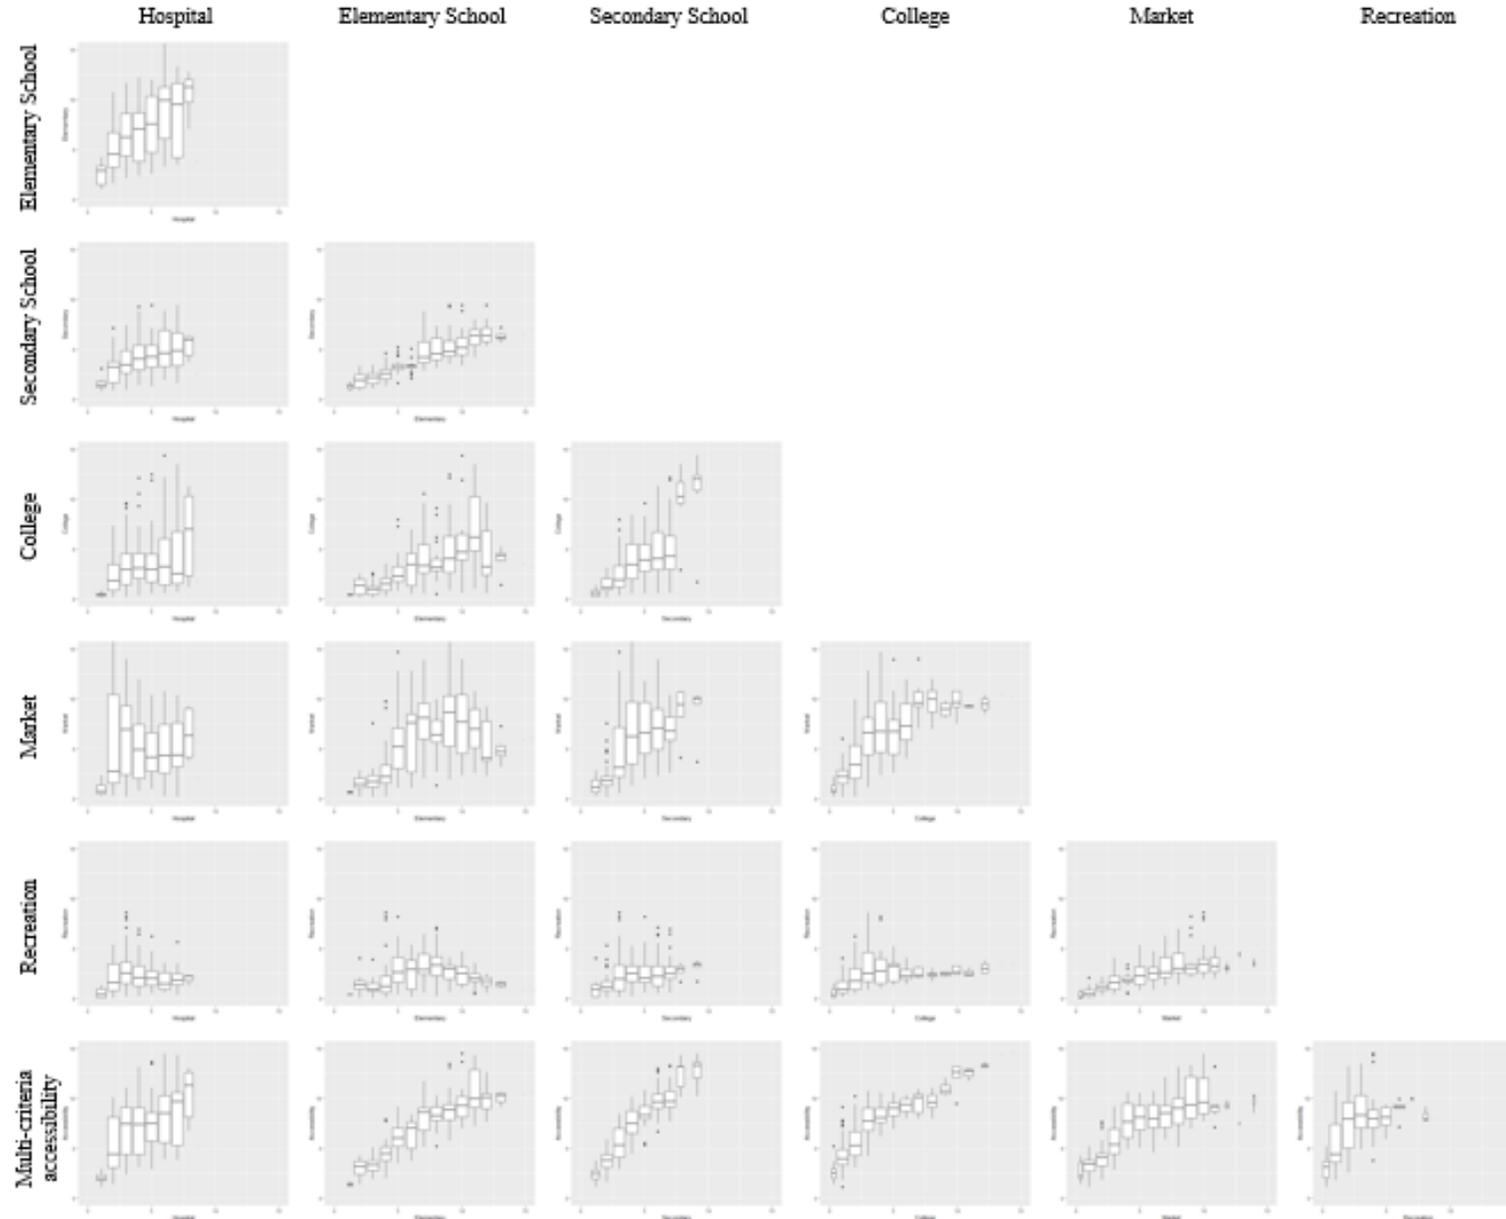

Metro Manila Zoning: 453 Zones

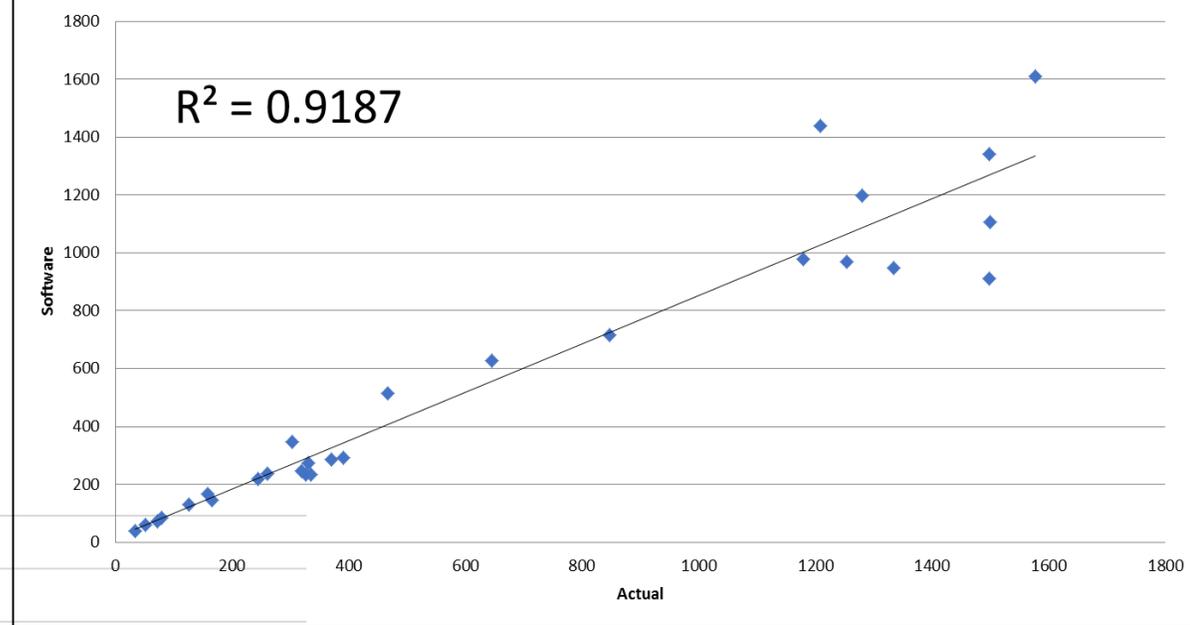

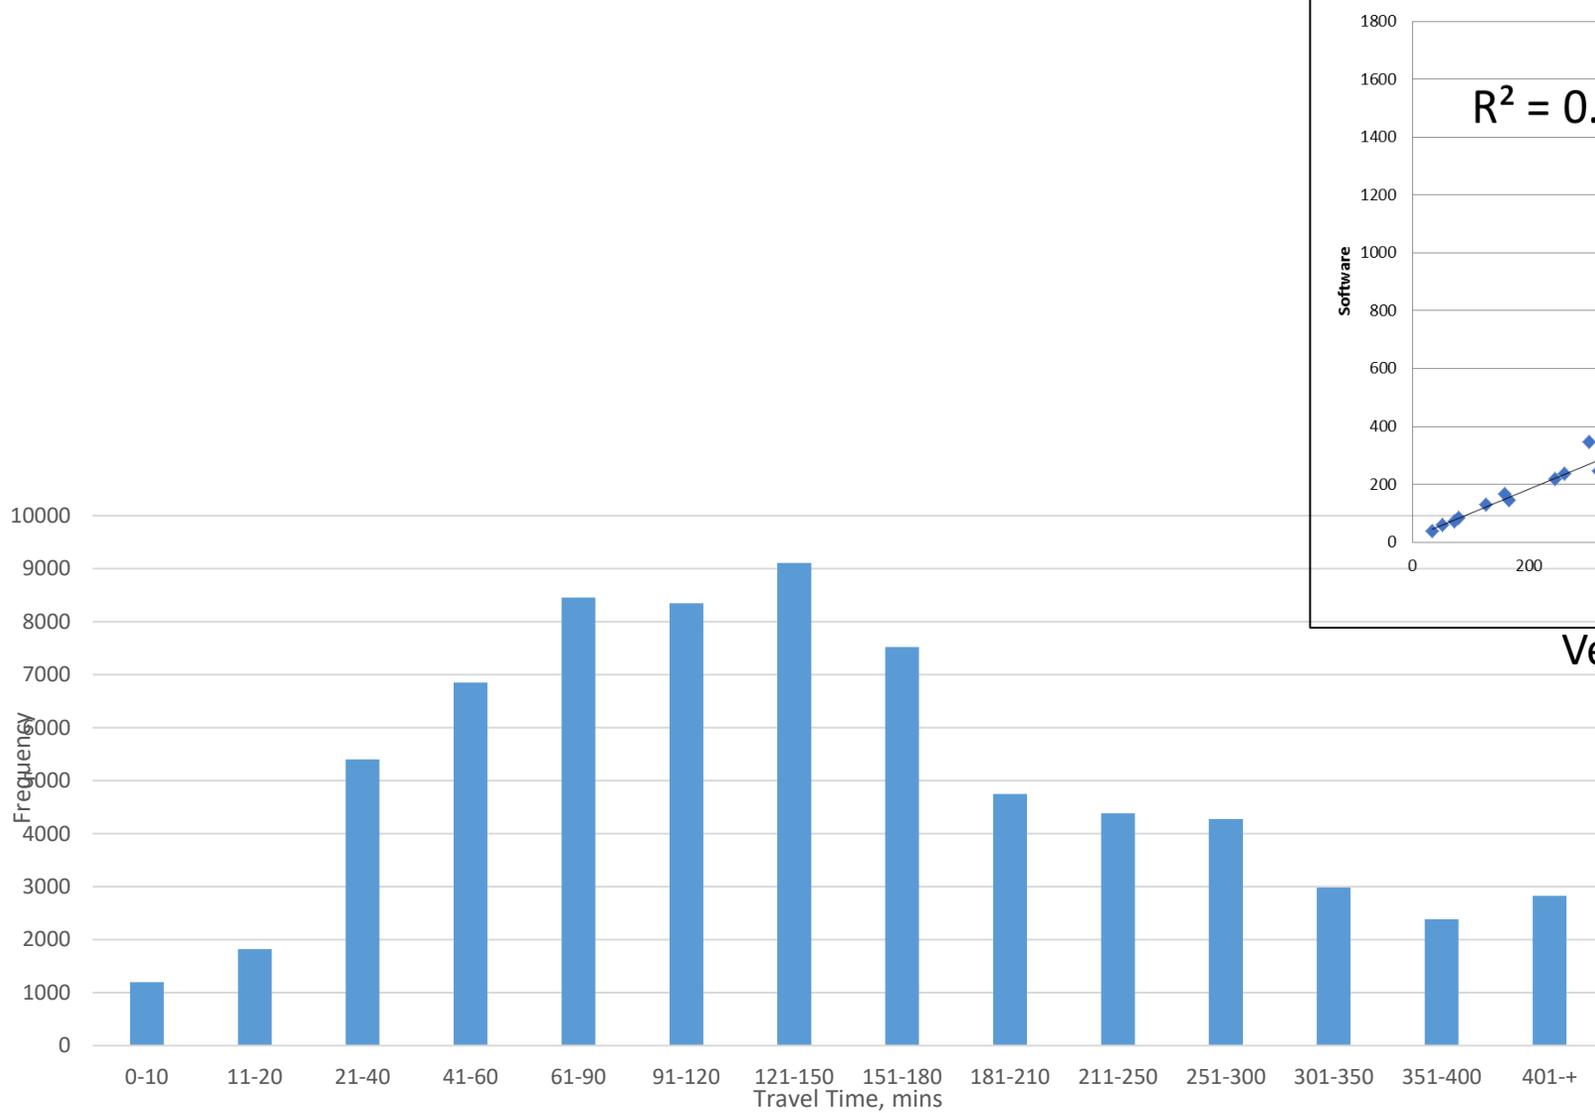

- A fast computer is needed to analyze the expanded network.

Adjusted MUCEP (2014) data (under calibration)

Big Data Application to Transport Accessibility

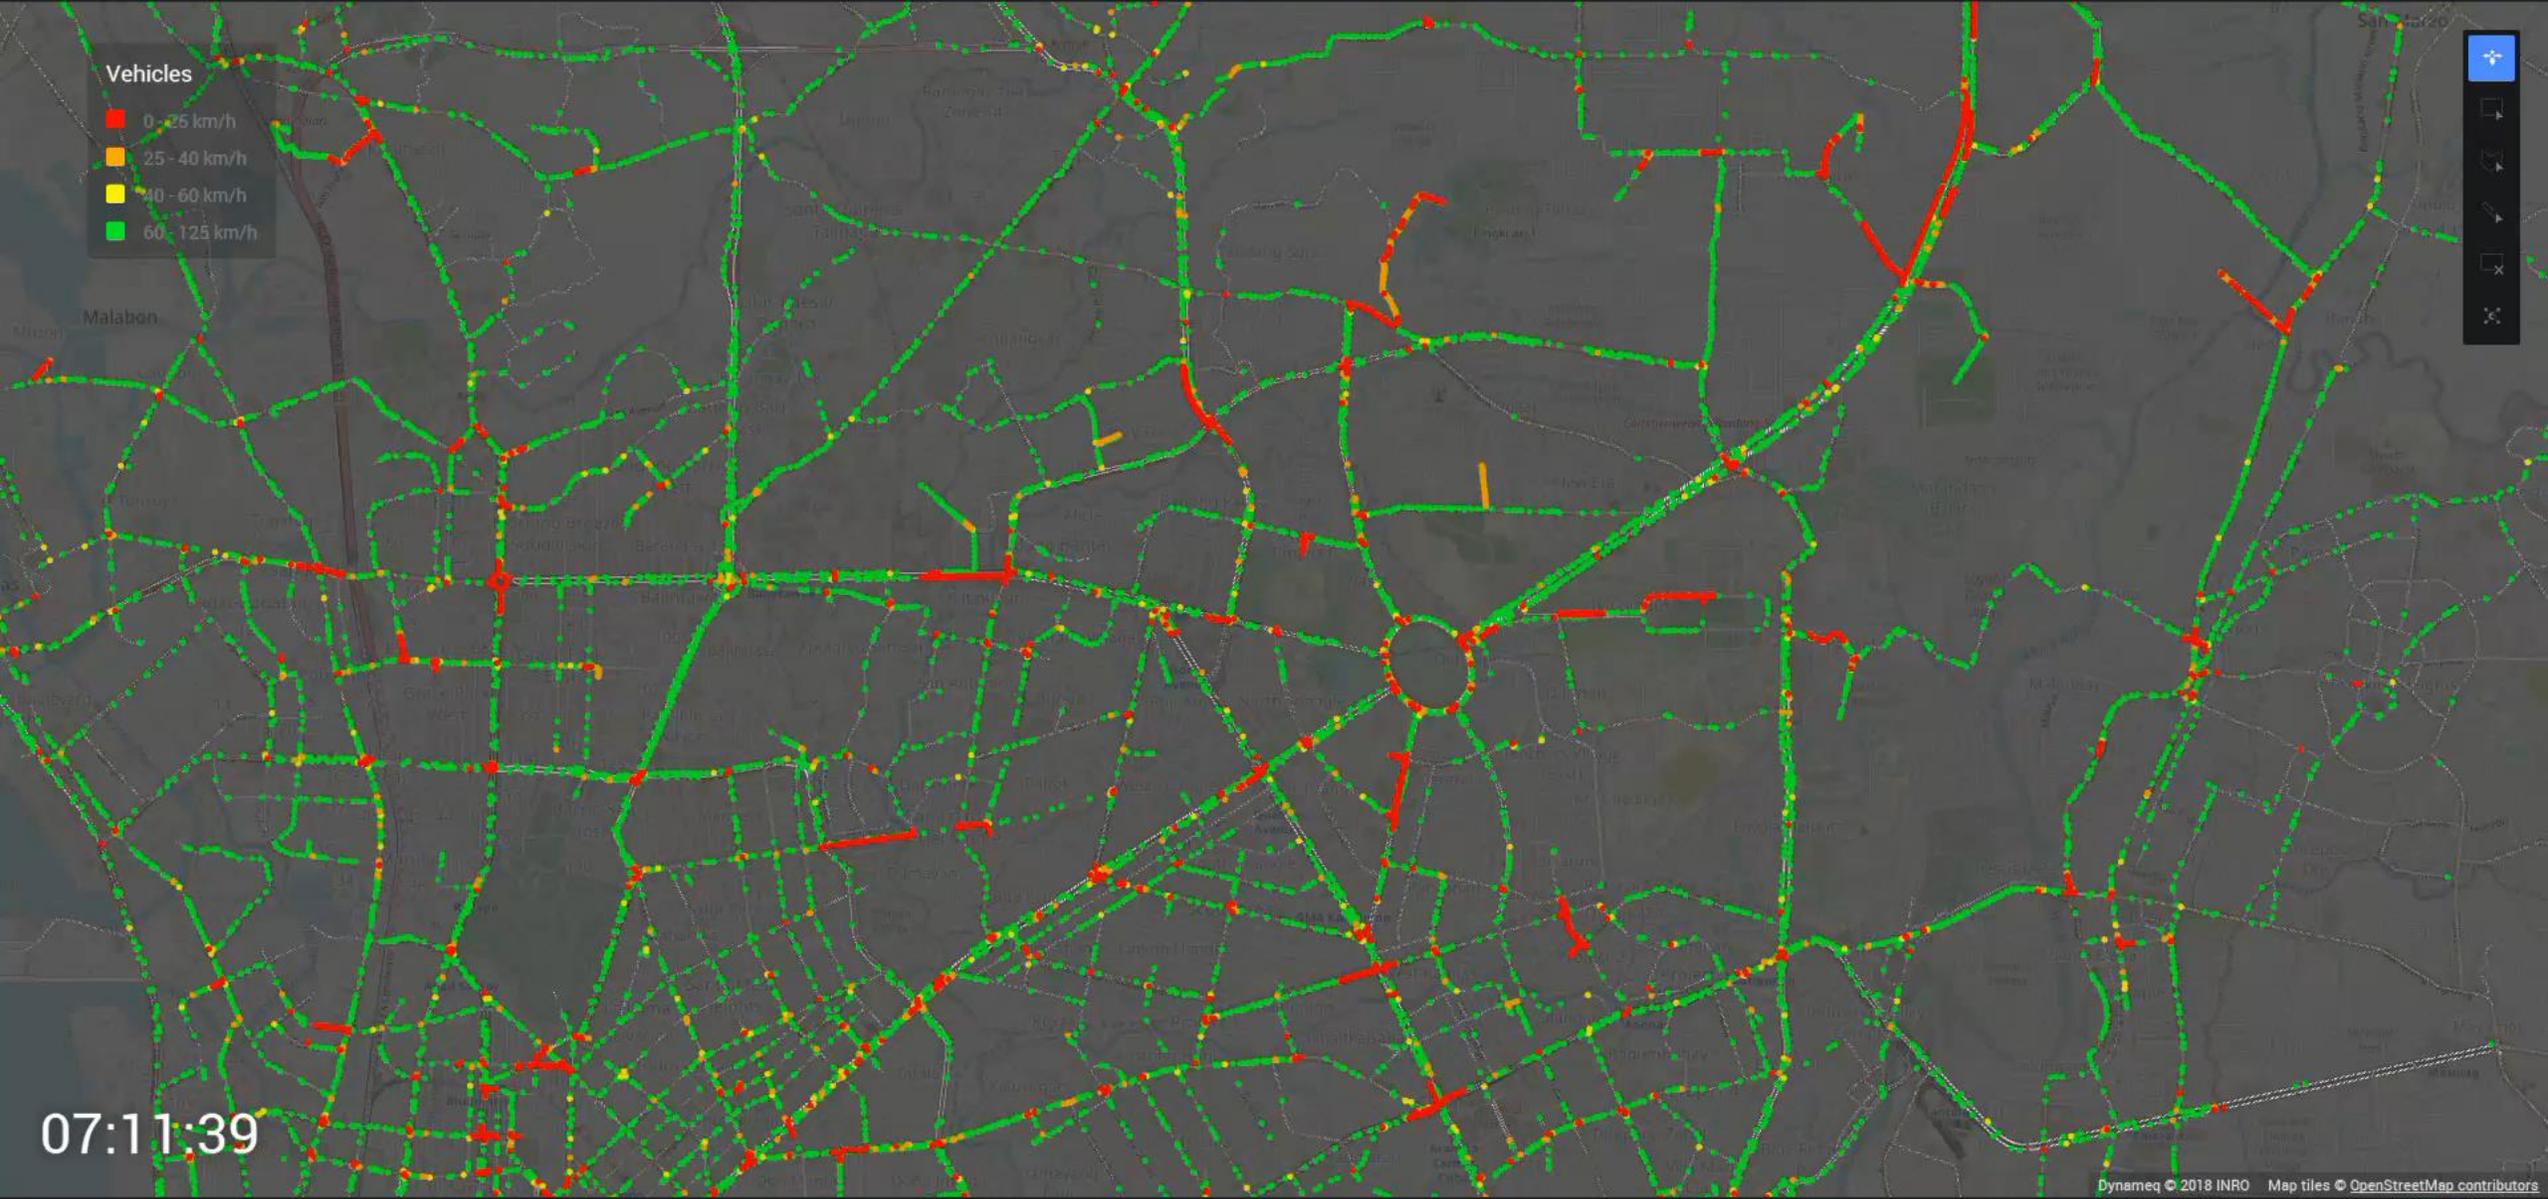

Vehicular volume along road segments
(Actual vs. simulated)

Zone to Zone Calibration at Average Travel in Metro Manila: 1.7 hours (under calibration) for morning peak period

Vehicles

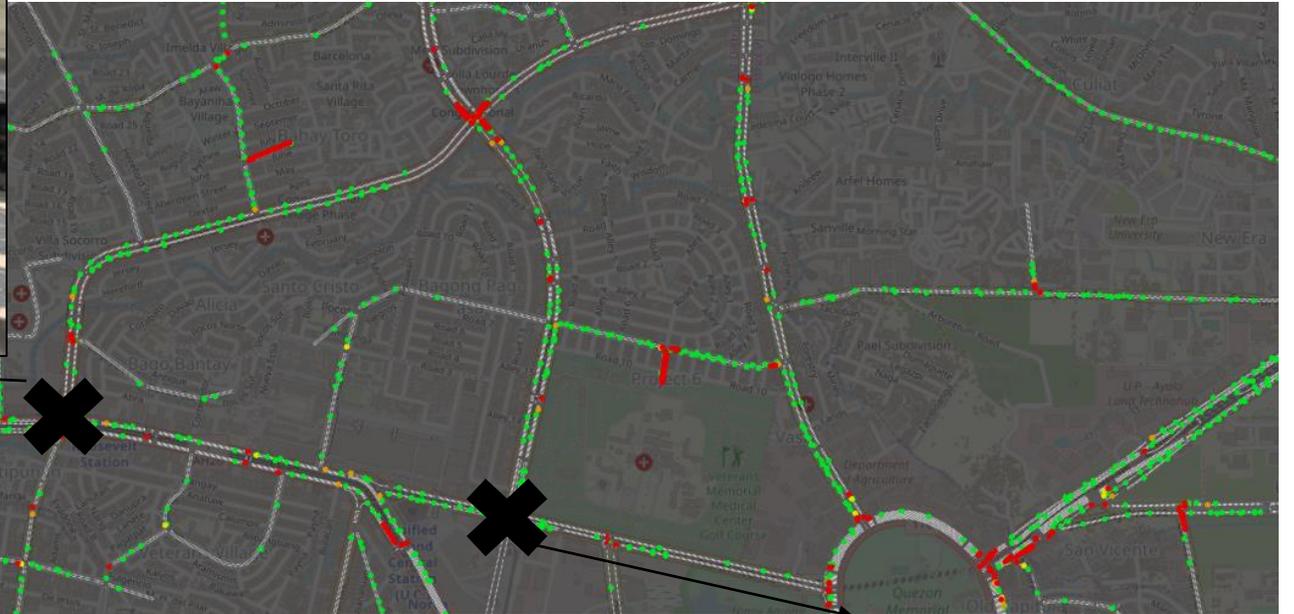

- 0 - 25 km/h
- 25 - 40 km/h
- 40 - 60 km/h
- 60 - 125 km/h

Summary:

- Dynamic traffic assignment modeling is a faster way of assessing proposed transport infrastructure projects and traffic management schemes (i.e. traffic signalization, directional flow improvements) through scenario modeling
- Once baseline condition is properly calibrated, it is easy to revisit, update, run the impact of propose transport projects through simulation.
- Trial-and-error approach in the field can be avoided
- Decision makers can easily appreciate the potential impact of proposed transport projects/traffic mgt. schemes through traffic simulation

ACKNOWLEDGEMENT

The Research Team would like to thank DOST-PCIEERD for the research funds provided for this project.

END

**Thank you for your
kind attention!**
